330400 and 330425 Accelerometer Acceleration Transducers

Datasheet

Bently Nevada Machinery Condition Monitoring

141638 Rev. AA

Description

These accelerometers are intended for critical machinery applications where casing acceleration measurements are required, such as gear mesh monitoring. The 330400 is designed to address the requirements of American Petroleum Institute Standard 670 for accelerometers. It provides an amplitude range of 50 g peak and a sensitivity of 100 mV/g. The 330425 is identical except it provides a larger amplitude range (75 g peak) and a sensitivity of 25 mV/g.

Most common machine malfunctions (unbalance, misalignment, etc.) occur on the rotor and originate as an increase (or at least a change) in rotor vibration. For any individual casing measurement to be effective for overall machine protection, the system must continually transmit a significant amount of rotor vibration to the machine casing, or mounting location of the transducer.

In addition, be careful to install the accelerometer transducer on the bearing housing or machine casing. Improper installation may decrease the transducer amplitude and frequency response and/or generate false signals that do not represent actual vibration. Refer to the appropriate instruction manuals and Application Notes.

Upon request, Bently Nevada provides engineering services that can identify the appropriate machine housing measurements and installation assistance if needed.

Specifications

Parameters are specified from +20 to +30 °C (+68 to +86 °F) and 100 Hz unless otherwise indicated.

Operation outside the specified limits may result in false readings or loss of machine monitoring.

Electrical

330400

| Sensitivity | 10.2 mV/m/s² (100 mV/g) ±5%. | | |
|--|--|--|--|
| Acceleration range | 490 m/s ² (50 g) peak overall acceleration within the 10 Hz to 15 kHz frequency span. Vibration at frequencies above 15 kHz, especially at the transducers resonance will significantly decrease this range. | | |
| Amplitude Linearity | ±1% to 490 m/ s² (50 g) peak. | | |
| Broadband Noise Floor (10 Hz to 15 kHz) | 0.039 m/s2 (0.004 g) rms. | | |

330425

| Sensitivity | 2.5 mV/m/s² (25 mV/g) ±5%. | | |
|------------------------|--|--|--|
| Acceleration Range | 735 m/s ² (75 g) peak overall acceleration within the 10 Hz to 15 kHz frequency span. Vibration at frequencies above 15 kHz, especially at the transducer's resonance, will significantly decrease this range. | | |
| Amplitude Linearity | ±1% to 735 m/s2 (75 g) peak. | | |

| Broadband Noise Floor (10 Hz to 15 kHz) | 0.098 m/s² (0.01 g) rms. |
|--|--------------------------|
|--|--------------------------|

Both Units

| Both Units | | | 980 mm/s²/mstrain (0.100 g/mstrain) without Mounting | |
|---|---|-------------------------------------|---|--|
| Frequency Response | 10 Hz to 15 kHz | | Base (API adapter); | |
| | (600 cpm to 900,000 cpm) ±3dB; | For serial | 4.9 mm/s²/mstrain (0.0005 g/mstrain) with Mounting Base (API adapter) supplied with the | |
| | 30 Hz to 10 kHz | numbers | accelerometer. | |
| | (1800 cpm to 600,000 cpm) ±10% | preceded by the letter "G" | For units bearing serial numbers NOT | |
| Temperature Sensitivity | -11% to +3% typical over the operating temperature range. | (shipped prior to April 2004) | preceded by the letter "G", Bently Nevada | |
| Transverse Sensitivity | Less than 5% of axial. | | recommends installing with the Mounting Base to | |
| Mounted Resonant Frequency | Greater than 30 kHz. | | minimize base strain sensitivity. | |
| Amplitude of Resonant | 20 dB maximum. | Maximum cable length | 305 metres (1000 ft) with no degradation of signal. | |
| Peak | | Power requirements | | |
| Base Strain Sensitivity For serial | | Input Voltage -24 ± 0.5 Vdc. | | |
| numbers preceded by the letter "G" (including all new sensors | | Bias Current | 2 mA nominal. | |
| | 49 mm/s²/mstrain (0.005 g/mstrain) | Output Bias Voltage: | -8.5 ± 0.5 Vdc. | |
| | | Grounding | Case isolated. | |
